PRESENTATION DECK

PROJECT DESCRIPTION

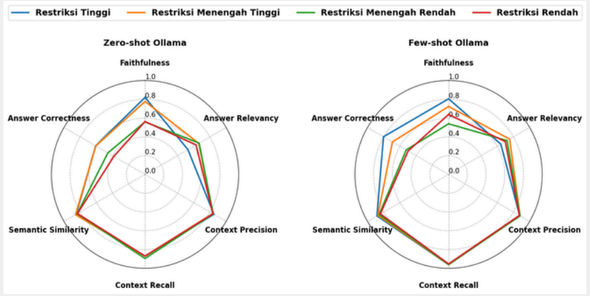

Nutrition Health Question Answering System is my undergraduate thesis project focused on developing an **AI powered Question Answering System** for the pediatric nutrition domain using **Retrieval Augmented Generation (RAG)**. The project was initiated to address the limitation of existing nutrition datasets that only contained question-answer pairs without sufficient contextual information. To overcome this, I implemented Synthetic Context Generation using Large Language Models to automatically generate supporting contexts, enabling the development of a more reliable and context-aware Question Answering system for nutrition professionals.

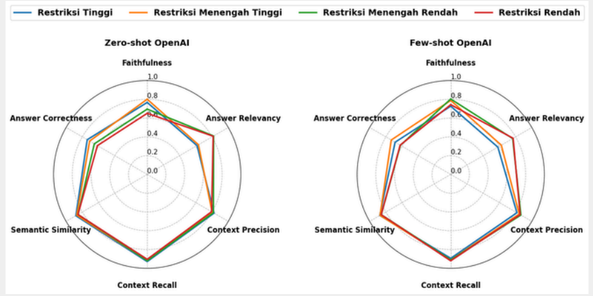

My role involved analyzing the needs and system requirements, designing the end-to-end RAG architecture, developing the synthetic context generation pipeline, preparing and processing nutrition datasets, integrating vector databases and Large Language Model APIs, and evaluating the system using quantitative metrics. **Through this project, I learned** how to develop an end-to-end AI-based information system, integrate multiple technologies into a single workflow, and build reliable solutions through systematic experimentation, iterative development, and comprehensive system evaluation.

PROJECT TITLE

AUTOMATED SENTIMENT ANALYSIS MLOPS PLATFORM

PROJECT DESCRIPTION

MBG Sentiment Analysis MLOps System is a team project developed to build an **end-to-end MLOps pipeline** for analyzing public sentiment toward Indonesia's **Makan Bergizi Gratis (MBG)** program using data from social media platform **X (Twitter)**. The project aimed to automate the entire machine learning workflow, from data collection and preprocessing to model training, deployment, monitoring, and continuous retraining, enabling the sentiment analysis system to remain scalable, reproducible, and maintainable.

My role focused on **data engineering** and **MLOps implementation**, including developing data collection workflows, preprocessing datasets, supporting model training and retraining pipelines, integrating machine learning workflows, and configuring the deployment and monitoring infrastructure using **Github actions, Docker, MLflow, PostgreSQL, MinIO, and Grafana.** Through this project, I gained practical experience in building production-ready machine learning systems, collaborating within a Git-based development workflow, and understanding how multiple services are integrated into a scalable MLOps architecture.

YEAR ACCOMPLISHED

PROJECT TITLE

MOMENIA INVITATION WEBSITE MAKER

YEAR ACCOMPLISHED

2026

ROLE/POSITION

- PRODUCT DESIGNER
- SOFTWARE TESTER

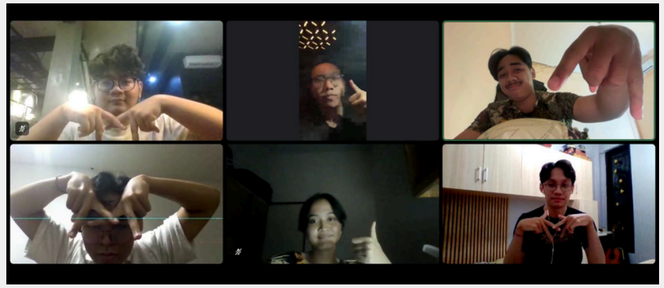

PUBLICATION LINK

FIGMA LINK

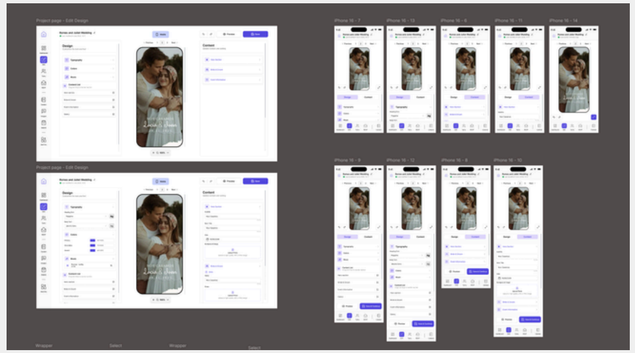

PROJECT DESCRIPTION

Momenia Invitation Website Maker is a **self-initiated group project** developed by Semeton Corp, where I contributed as a **Product Designer**. The idea came from our observation that Bali has many events, ceremonies, and celebrations that often require digital invitations, but creating an invitation website is usually expensive, manual, or difficult to customize without technical help.

To solve this, we designed Momenia as an **affordable and easy-to-use website builder** specifically for digital invitations. The platform **helps users create, customize, publish, and manage invitations** through editable templates, responsive layouts, add-ons, payment flow, guest management, RSVP tracking, guestbook, after-party notes, and easy deployment. My role involved translating product requirements into user flows, wireframes, high-fidelity interfaces, and responsive design concepts for both user and admin experiences. Through this project, **I learned** how to turn a **local market opportunity** into a **scalable digital product**, structure complex features into a clear user journey and UI/UX, and collaborate with a small startup team to prepare the product for future deployment.

USER FLOW LINK

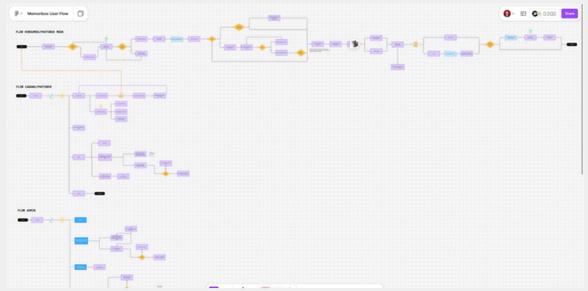

PROJECT DESCRIPTION

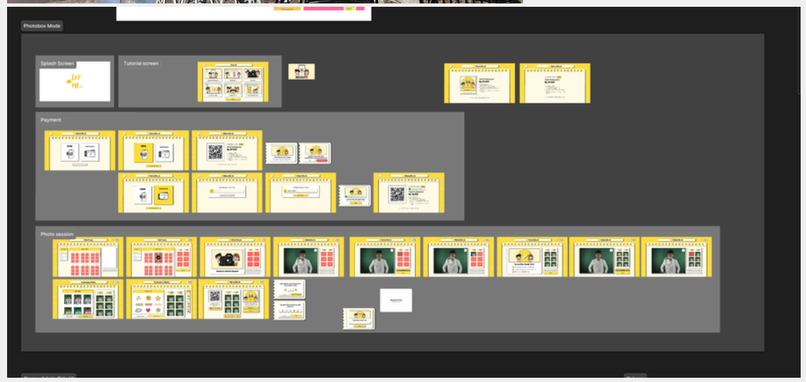

Memoribox Photobox System is a **freelance client-based group project** developed by Semeton Corp for memoribox.id, where I contributed as a **Product Designer, Product Manager, and Software Tester**. The project started from the need to transform a conventional photobooth experience into a more modern, efficient, and scalable digital system for events and business operations.

The solution focused on building an **self service integrated digital photobooth platform** with features such as payment gateway, template selection, photo retake, photo customization, automatic printing, digital photo delivery, cloud storage, admin analytics dashboard, and other configurable features. My role involved **gathering client requirements**, defining **user flows**, **designing wireframes and high-fidelity interfaces**, and supporting **User Acceptance Testing** with the client. Through this project, I **learned** how to **manage a real client-based product**, translate business needs into clear product features, and collaborate with a small startup team to create a scalable, efficient, and user-friendly digital photobooth experience.

TRAVLR MOBILE APPS

TRAVLR

YEAR ACCOMPLISHED

2025

ROLE/POSITION

- UI/UX DESIGNER INTERN

PUBLICATION LINK

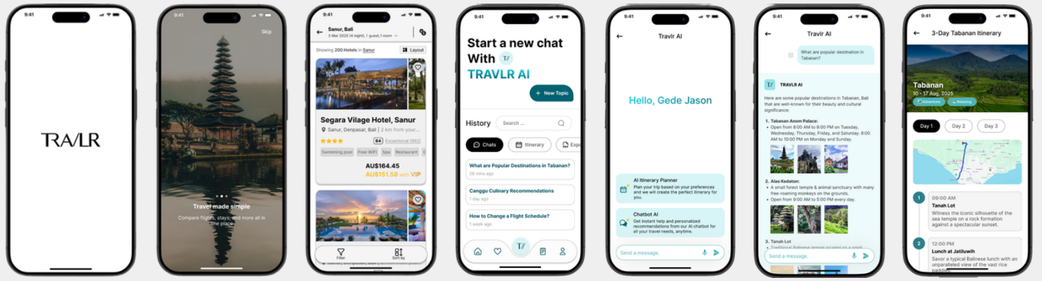

PROTOTYPE LINK

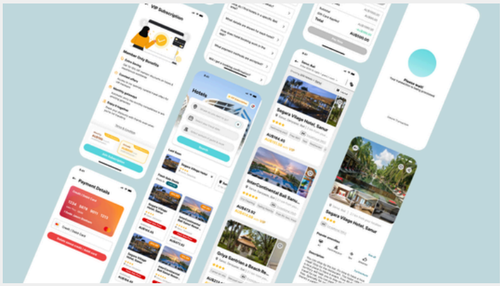

FIGMA LINK

PROJECT DESCRIPTION

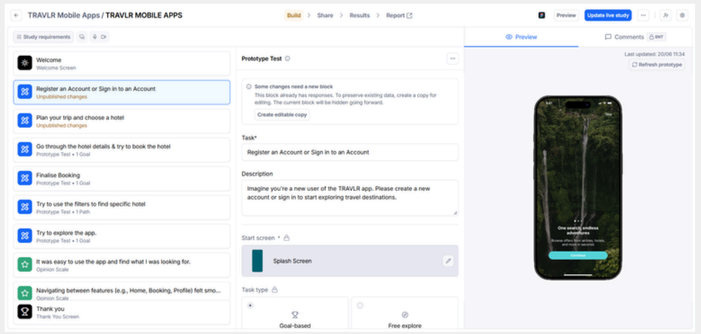

TRAVLR Mobile Apps is a **work-based group project** developed during my internship at **PT TRAVLR GUIDES INDONESIA**, where I worked with one fellow UI/UX Designer Intern. The project aimed to transform an existing web-based travel platform into a **redesigned mobile-first experience**, as research showed that most users accessed the platform through mobile devices. The app helps users discover destinations, explore accommodations, manage bookings, and plan their trips more intuitively.

My role involved analyzing **user behavior, demographic insights, internal data, and existing product flows** to identify user needs and design opportunities. I contributed to creating competitor analysis, user flows, wireframes, high-fidelity designs, prototypes, design iterations, and the **Travlr AI feature innovation** concept for personalized travel discovery. The design was validated through Maze **usability testing** with 23 respondents across 14 testing blocks, helping the team refine the experience based on real feedback. Through this project, I **learned** how to **work in a real industry environment**, collaborate with cross-functional teams, and balance user needs, business goals, and technical considerations.

MINDFULLME

Mindfulme

YEAR ACCOMPLISHED

2024

ROLE/POSITION

- PRODUCT DESIGNER

PUBLICATION LINK

PROTOTYPE LINK

FIGMA LINK

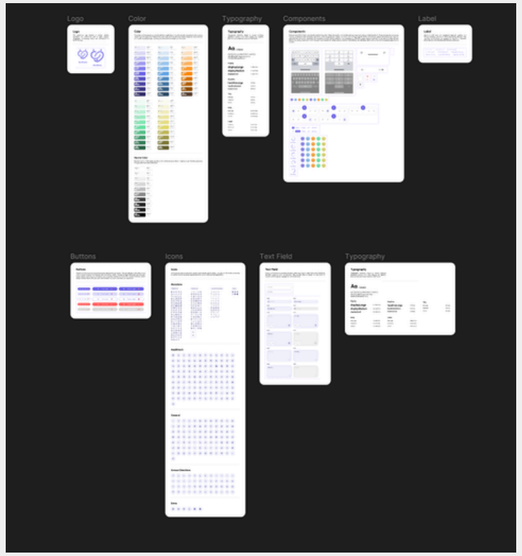

PROJECT DESCRIPTION

MindfulMe App is a **hackathon-based group project** developed during Raion HackJam 2024, where I collaborated with Product Managers, UI/UX Designers, and a Programmer as a **UI/UX Designer**. The project responded to the growing attention toward mental health issues and aligned with the event's SDGs-related challenge by creating a digital solution that supports emotional well-being.

Through **user research** and **user persona** development, we identified the need for a safe space to express emotions, track mental conditions, share stories, and access professional support. Based on these insights, we designed features such as **daily journaling, read and write story, psychologist consultation, and mood-related support**. I contributed to brainstorming, user flow, interface design, prototyping, and usability testing using **SUS and Maze**. Through this project, I **learned** how to **work quickly** under hackathon constraints, **collaborate** across PM, design, and programming roles, and turn user insights into a meaningful digital solution. The project received a **"Best Design"** nomination.

FIGMA LINK

PROJECT DESCRIPTION

StuntCare is a **group project** developed during my internship program at Raion Community, where I collaborated with Product Managers, UI/UX Designers, and Programmers. The project aimed to **support pregnant women** in **preventing stunting** from the early pregnancy stage by providing accessible health information, nutrition guidance, pregnancy progress tracking, and supportive digital features.

My role involved conducting **user research** with expectant mothers, developing **user personas**, identifying key user needs, and contributing to the design process from **wireframes, high-fidelity designs,** to **interactive prototypes**. Based on the research insights, our team applied a **design thinking process** to create features such as **Anti-Stunting**, **Procare**, and **Stream**. The project achieved a **System Usability Scale result of 81.5%**, helping validate the usability of the solution. Through this project, I **learned** how to **collaborate** in a multidisciplinary team, work through a **structured product development process**, and design a health-focused digital solution aligned with the SDGs, especially in supporting maternal and child health.
